

PROTECT YOUR PET

Pets are especially vulnerable to the risks associated with cosmetic pesticides because of their physiology and behaviour.

Pesticide
free is
best for
me!

DID YOU KNOW?

Humans, especially children, can increase their own exposure to pesticides because of close contact with their furry friends.

Our animal friends love to sniff, roll, and play in the grass and then groom themselves by licking their paws and fur. If pesticides are present they are being exposed by ingestion and through the skin and nose.
